“The Relationship Between Toddler’s Mother Employment Status With Frequency of Visits to IHC (Integrated Health Center) Karangturi Kalicilik Demak”

xv+ 44 pages + 3 tables + 9 attachment

Many factors can lead to vary the frequency of visits to the IHC. These factors include the age of five, the number of children under five in the family, or employment status of the toddler’s mother, mother’s education level and knowledge of mothers about toddler IHC. Based on the monthly report, the frequency of visits to the IHC in the village toddler’s village Kalicilik 2012 to 2013 there were still below 50% and also plummeted in September of 2013 is up 22.11% this study aimed to analyze the relationship between maternal employment status toddler the frequency of visits to the IHC Karangturi Kalicilik village Demak.

This type of research is survey analytic cross sectional study. Total population of 97 people and 31 people were sampled. Saturated sampling data were analyzed by descriptive univariate and bivariate analysis, namely (chi-square test, and Fisher exact test) \( p < 0.05 \).

Fisher exact test results show that there is a relationship between toddler’s mother employment status with the frequency of visits to IHC Kalicilik Karangturi Demak, with \( p = 0.007 \).

It is recommended to provide information and input to the local health center in order to provide adequate facilities and giving counseling to the cadre and mothers about the importance of Toddlers.

Keywords: Employment Status, Frequency of Visits, Toddler’s Mother
