CHAPTER 1 INTRODUCTION

1.1. Background 1
1.2. High Speed Railway Jakarta – Bandung 5
1.3. Problem Limitation 6
1.4. Objective of the Study 6
1.5. Scope of the Study 7

CHAPTER 2 LITERATURE REVIEW

2.1 Introduction 8
2.2 High Speed Railway Track 8
2.2.1 Design Principles 9
2.2.2 Ballastless system in use 10
2.3 High Speed Railway Track Structure 12
2.3.1 Forst Protection Layer 13
2.3.2 Hydraulic Bound Layer 14
2.3.3 Slab Concrete C 30/37 15

2.3.4 Reinforcement concrete.....15
2.3.5 Sleeper B355 Distance 650 Mm.....16
2.3.6 Rail Fastening.....17
2.3.7 Rail 60EI 18
2.4 High Speed Train.....19
2.5 Structure Type of High Speed Railway.....21
2.5.1 Standard Aerial Viaduct.....22
2.5.2 Balance Cantilever 23
2.5.3 Half Through Girder.....25
2.5.4 Bathub Beams 25
2.5.5 Truss.....26
2.5.6 Elevated Slab.....28
2.5.7 U-trough (Grade separation) 29
2.5.8 Box culvert.....30
2.6 Box Girder Calculating Method 32
2.6.1 Working Stress Method.....32
2.6.2 Limit State Method.....33
2.7 The Sequences of Box Girder Calculation 33
2.7.1 Planning of Prestressed beams 33
2.7.2 Box Girder Loading 34
2.7.3 Prestress Cable Calculations 39
2.7.4 Tendon position.....39
2.7.5 Calculation of loss of prestressing force 40
2.7.6 Reinforcement of Prestressed Beams.....42
2.7.7 Elastomers.....44
2.8 Summary.....46

CHAPTER 3 DESIGN AND METHODOLOGY

3.1 Introduction.....46
3.2 Premilinary design.....46

3.2.1 Limit State Method....48
3.2.2 Working Sress Method....48
3.3 Box Girder Dimention....49
3.4 Section Properties....49
3.5 Box Girder Loading....52
3.5.1 Self Weight Contruction (MS)....52
3.5.2 Superimposed dead load (MA)....53
3.5.3 Live Load (LL)....55
3.5.4 Wind Load (EW)....55
3.5.5 Earthquake Load (EQ)....57
3.5.6 Resume Moments and shear force on a Beam....58
3.6 Prestress forces, Eccentricity, and Number of Tendon....59
3.6.1 Initial Conditions when transfer....59
3.6.2 End Conditions when service....61
3.7 Tendon position....62
3.8 Loss of Presstress....64
3.8.1 Achorage Friction....64
3.8.2 Jack Friction....64
3.8.3 Elastic shortening....65
3.8.4 Achoring....68
3.8.5 Loss of prestress due to Relaxation of Tendon....69
3.9 Stress that Occurs due to Prestress style....75
3.9.1 Initial condition when tranfer....75
3.9.2 End condition when service....76
3.10 Stress on the box girder due to load....77
3.10.1 Stress due to Self Weight (MS)....77
3.10.2 Stress due to superimposed dead load (MA)....78
3.10.3 Stress due to shrinkage and creep (SR)....78
3.10.4 Stress due to prestress (PR)....82
3.10.5 Stress due to live load (LL)....82
3.10.6 Stress due to wind load (EW)....83

3.10.7 Stress due to earthquake load (EQ).....84
3.10.8 Stress due to Effect of Temperature (ET).....84
3.11 Control stress against combination of loading.....86
3.11.1 Control stress againts of combination 1.....86
3.11.2 Control stress againts of combination 2.....86
3.11.3 Control stress againts of combination 3.....86
3.11.4 Control stress againts of combination 4.....86
3.11.5 Control stress againts of combination 5.....86
3.12 Box Girder Deflection 86
3.12.1 Deflection in the initial state (transfer) 86
3.12.2 Deflection after loss of prestress.....87
3.12.3 Box girder deflection due to load 88
3.13 Deflection control of Load Combinations.....90
3.14 Ultimit review of box girder prestress.....91
3.14.1 Capacity ultimate moment.....91
3.14.2 The ultimate moment due to load 93
3.14.3 Control combination of moment ultimate 96
3.15 End Block Enlargemnet.....96
3.15.1 Calculation of stirrups for bursting force.....96
3.15.2 Number of stirrup used for bursting force 97
3.15.3 Overwiew of shear force.....97
3.16 Reinforcement Box girder 98
3.17 Review of Slab Floor Bridge 99
3.17.1 Self weight.....99
3.17.2 Superimposed dead load 99
3.17.3 Wind load 99
3.17.4 Effect of temperature 99
3.17.5 Ultimit moment on the slab of the bridge floor 99
3.17.6 Slab enlargement.....99
3.17.7 Control deflection of slab 102

CHAPTER 4 DESIGN AND CALCULATION

4.1 Introduction.....107
4.2 Premilinary Design.....107
4.2.1 Specification of box girder.....108
4.2.2 Specification of concrete.....108
4.2.3 Specification of steel.....109
4.3 Dimension of Box Girder.....109
4.4 Section Properties of Box Girder.....110
4.5 Box Girder Loading.....114
4.5.1 Self weight construction (MS).....114
4.5.2 Superimposed Dead Load (MA).....115
4.5.3 Live Load (LL).....117
4.5.4 Wind Load (EW).....119
4.5.5 Earthquake Load (EQ).....120
4.5.6 Resume moment and shear force and beam.....121
4.6 Pretress forces,Eccentricity,and Number of Tendon.....124
4.6.1 Initial conditions when transfer.....124
4.6.2 End condition when service.....125
4.7 Tendon position.....126
4.8 Loss of Presstress.....130
4.8.1 Anchorage friction.....131
4.8.2 Jack friction.....131
4.8.3 Elastic shortening.....131
4.8.4 Anchoring.....133
4.8.5 Loss of prestress due to relaction of tendon.....134
4.9 Stress that Occurs due to Prestress style.....137
4.9.1 Initial condition when transfer.....138
4.9.2 State after loss of prestress.....138
4.10 Stress on the box girder due to load.....138
4.10.1 Stress due to self weight (MS).....138
4.10.2 Stress due to Superimposed Dead Load (MA).....139

4.10.3 Stress due to Shringkage and Creep (SR) 139
4.10.4 Stress due to Prestress (PR) 141
4.10.5 Stress due to Live Load (LL) 141
4.10.6 Stress due to Wind Load (EW) 142
4.10.7 Stress due to Earthquake Load (EQ) 142
4.10.8 Stress due to effect of temperature (ET) 143
4.11 Control stress against combination of loading 144
4.11.1 Control stress againts combination 1 144
4.11.2 Control stress againts combination 2 144
4.11.3 Control stress againts combination 3 145
4.11.4 Control stress againts combination 4 145
4.11.5 Control stress againts combination 5 145
4.12 Box Girder Deflection 146
4.12.1 Deflection in the initial state (transfer) 146
4.12.2 Deflection after loss of prestress 146
4.12.3 Box girder deflection due to load 147
4.13 Control Deflection of Load Combinations 149
4.14 Ultimit review of box girder prestress 150
4.14.1 Capacity ultimit moment 150
4.14.2 The ultimit moment due to load 152
4.14.3 Control combination of moment ultimit 154
4.15 End Block Enlargement 155
4.15.1 Calculation of stirrups of bursting force 157
4.15.2 Number of stirrups for bursting force 159
4.15.3 Overview of shear force 159
4.16 Box Girder Enlargement 162
4.16.1 Edge wall plate 162
4.16.2 Bottom wall plate 163
4.16.3 Upper wall plate 163
4.17 Riview of Slab Floor Bridge 164
4.17.1 Self weight 164

4.17.2 Superimposed Dead Load 165
4.17.3 Wind Load 165
4.17.4 Effect of temperature 165
4.17.5 Ultimite moment on the slab of the bridge floor 165
4.17.6 Slab enlargement.....166
4.17.7 Control deflection of slab 168

CHAPTER 5 CONCLUSIONS AND RECOMENDATIONS

5.1 Conclution.....171
5.2 Recommendation.....173

LIST OF ABREVITATION

A = Area

A_{plat} = Sectional area of the upper plate

A_s = Area of non – prestressed stress reinforce

A_{s1} = Area of compression reinforcement

A_{st} = Nominal expression of one strands

A_t = Wide look of prestress steel

B = Traffic lane width

b = Width of flange of flanged member or wifth of rectangular member

C = Relaxation after 1000 hour at 70% breaking load

c = The earthquake response factor is expressed in gravitational acceleration.

C_{c1} = Internal presstress tendon

C_{EW} = Drag coefficient (1.20)

C_f = The residual creep factor

d = Distance from extreme compressive fiber to cetroid of the prestressing force, or to centroid of reinforcing for precast giirder bridges made continous.

d’ = Distance from the extreme compressive fiber to the centroid of the non – prestressed stress reinforcement

e = Natural number (2.7183)

e’ = Eccentricity of tendon

E_c = Modulus elasticity of concrete

e_m = Theorotical thickness

e_p = Eccentricity of temperature

E_s = Modulus elasticity of steel

e_s = Eccentricity of tendon

$f : e_s$ = Eccentricity of tendon

$f’_c$ = Compressive strength of concrete

f_a = Concrete stress in the upper fiber

f_{ar} = Stress in the upper fiber for creep

f_b = Concrete stress in the bottom fiber

$f_c : f_b$ = Concrete stress in the bottom fiber

f_{ci}' = Compressive strength of initial state concrete

f_{eff} = Effective stress of prestress steel

f_{ps} = Strong yield stress prestress

f_{pu} = Tensile strength of strength

f_{py} = Yield stress of strands

f_y = Tensile stress of reinforcing steel at the time of yield

G = Modulus Shear

g = Earth gravity acceleration (9.81 m/det2)

i = Fingers of inertia

I_b = Inertia moment due to bottom of box girder

I_o = Inertia moment

I_x = Inertia moment to the line weight of box girder

K = Circum ference of box girder cross section

K_b = Water cement ratio for high quality concrete with cement water 0.040 and cement

k_c = Coefficient that depends on air humidity, for calculations taken dry conditions with

k_d = Coefficients that depend on the degree of hardening of concrete when encumbered

K_e = Coefficient that depend on the theoretical thicnessΔL

kN = Kilo Newton

kNm = Kilo Newton Meter

kN/m = Kilo Newton per Meter

K_p = Coefficients that depend on the extent of steel reinforcecement extends

kPa = Kilo Pascal

k_{tn} = Coefficients that depend on time where hardening occurs and theoretical thickness

L = Long span of box girder

L_{max} = Distance of critical influence of anchor slip from top

L_x = Distance from top to the middle of span

m = Meter

M_{bs} = Maxsimum moment in the middle of span

M_{ET} = Moment due to temperature

M_{EW} = Maximum moment due to wind load

M_{LL} = Maximum moment due to live load

mm = Mili Meter

M_{MA} = Maxsimum moment due to superimposed dead load

M_{MS} = Maximum moment due to self weight construction

M_n = Nominal moment strength of setion

MPa = Mega Pascal

M_{PR} = Moment due to prestress

M_R = The moment due to creep

M_{RS} = Moment due to shringkage and creep

M_S = The moment due to shringkage

M_{uk} = Ultimate moment capacity

n = Number of box girder

P = Percentage of reinforcecement area extends to the cross section area

P'_{max} = The prestress force due to jacking after stress loss due to anchorage friction (97% of Pj) is reduced by half of the voltage loss due to burial ($\Delta p / 2$)

P_{bs} = load break at least one stand's / Minimal load break

P_{bs1} = Load break one strands

P_{bs1} = A single drop of tendon / load break one stands

P_{eff} = Prestress force at the end state

P_i = Stress in the middle of the span

P_j = Prestress force due to jacking

P_{max} = Maximum nominal prestress voltage after stress loss due to elastic shortening

P_o = Percentace of yield stress on steel prestress

P_s = Internal forces arising from shringkage

P_t = Prestress force at the initial state

P_x = Loss of prestress due to friction wires

Q_{BS} = Self weight of box girder

Q_{EW} = Self weight due to wind load

Q_{MA} = Self weight due to superimposed dead load

Q_{MS} = Self weight construction

S = Longitudinal spacing of the web reinforcement

t = Number of days of hardening at the time of the average temperature

T = Average temperature

t' = Age of concrete hardening corrected when burdened

t_a = Thickness of slab

T_a = Uper temperature

T_b = Bottom temperature

T_{EW} = Wind load

th = Thick puddle of rain

T_{ps} = Internal force of prestressed steel tendon

UTS = Stress due to load broken

υ = Poison number

V_{bs} = Maximum shear force on the suport

V_{LL} = Maximum shear force due to live load

V_{MA} = Maximum shear force due to superimposed dead load

V_{MS} = Maximum shear force due to self weight construction

V_W = Wind speed plan

w'_c = Reinforce concrete

w''_c = Concrete

W_a = Moment of section resistance from the upper fiber to the line weight

W_b = Moment of section resistance from the bottom fiber to the line weight

w_c = Concrete prestress

W_t = Total weight of structure

w_w = Rain water

X = Distance prestress steel before loss of prestress

x1 = The distance from the center to the short center of the closed spade

y = Distance to the bottom fiber

y1 = Distance from the center to the long center of the closed span

y_a = Distance of line weight from the upper fiber

y_b = Distance of line weight from the bottom fiber

y_d = Positionof the tendon in the middle of span

y_d' = Set

Z_o = Distance from base

α = Change in the total angel of the tendon

β = Wobble coefficient

$\Delta\varepsilon_{su}$ = Influence shringkage

Δ_L = Entry lenght

Δ_P = Loss of prestress due to an anchor

Δ_{Pe} = Loss of prestress due to elastic shortening

$\Delta\sigma_{Pe}$ = Loss of prestress on steel by elastic shortening without self weight influence

$\Delta\sigma_{Pe}'$ = Loss of prestress on steel by elastic strain with self weight influence

$\Delta\sigma_{sc}$ = Stress due to creep and shringkage

ε_b = Basic shrinngkage strain for dry condition air with moisture

ε_{cr} = Strain due to creep

μ = Friction curvatur coefficient

ρ_p = Ratio of cross section of steel prestress

$\sigma 1$ = Service stress due to self weight construction

$\sigma 2$ = Service stress due to dead load and superimposed dead load

σ_{bt} = Concrete stress at the steel level by the influence of the prestress force

σ_{cr} = Stress due to creep

σ_{pi} = Prestressed steel before loss of prestress

σ_r = Stress due to creep

σ_{sh} = Stress shringkage

ω = Trac
