**RELATIONSHIP BETWEEN ANXIETY TO THE LEVEL OF INSOMNIA IN
FURTHER SOCIAL SERVICES IN THE AGE OF POTROYUDAN JEPARA**
65 pages + 10 tables+ 2 pictures + 12 appendices + xv

Background: Insomnia is a condition where a person feels difficult to sleep. This sleep difficulty concerns the length of sleep (quantity) or the darkness (quality) of sleep. Insomnia can affect work, social activities, health status of the sufferer. Insomnia is caused by anxiety suffered by the elderly whose impact is not yet clear. This study aims to determine the anxiety of the elderly based on the characteristics of the respondents.

Research Methodology: The method in this study is descriptive correlative with a cross sectional approach. The total sample was 40 people taken by *total sampling technique*. Data collection used the *STAI (State-Trait Anxiety Inventory) questionnaire* and *Insomnia Severity Index (ISI) questionnaire*. The data obtained is processed using the test *Chi-Square*.

Results: The study showed data that the average age was 69 years, 55.0% of respondents were female, 47.5% of respondents were educated last elementary school, 65.0% of respondents were married, the level of insomnia was at the most moderate level of 55.0%. *state anxiety is* at most in the moderate category 77.5% and *trait anxiety is* at most in the moderate category 82.5%. Insomnia is at most moderate levels of 55.0%. test results *Chi-square* obtained values *anxiety state* with *p-value* 0.027 and *trait anxiety* with *p-value* 0.002.

Conclusion: There is a relationship between anxiety towards the level of insomnia in the elderly at the Potential Middle Aged Social Service Home and Jepara. So it is recommended for nurses to conduct assessment and management of anxiety.

Keywords: *State anxiety, Trait anxiety, Level of insomnia*
