MOTIVATION ELDERLY FOR VISITING TO ELDERLY POSYANDU IN
VILLAGE KARANGREJO WONOSALAM DISTRICT OF DEMAK
2013

10 i + 53 pages + 3 table + 1 chart + 1 diagram + 12 appendix

Healthy Indonesia 2010 as a healthcare paradigm has been on the doorstep. Some health indicators to be achieved include decreased morbidity, mortality and increased life expectancy which has yet to be fulfilled. One of the efforts to increase the life expectancy is increasing life expectancy in the elderly in the world including Indonesia. The government set up programs for elderly neighborhood health center which aims to improve the health of the elderly. Motivation research purposes to determine the Elderly for Visiting to IHC Elderly Seniors Village Karangrejo Wonosalam Demak district in 2013.

Descriptive research approach with a cross sectional survey conducted in July 2013. The total sample of 66 elderly people in the village district Karangrejo Wonosalam Demak regency with the type of sampling using the cluster random probability sampling. Sampling research instrument used is enclosed questionnaire and analyzed using univariate analysis.

The results showed the majority of respondents had low motivation as much as 52%, and a minority of respondents have a high motivation as much as 48%.

Elderly conclusions about the research on motivation visiting to IHC at 66 Seniors can conclude the majority of respondents had low motivation as much as 52%.
