HUBUNGAN ANTARA PELAKSANAAN PENILAIAN RISIKO JATUH DENGAN TERJADINYA INSIDEN KESELAMATAN PASIEN DI RUANG RAWAT INAP RSISA SEMARANG

59 hal + 13 tabel + xviii

Latar Belakang:

Pelaksanaan penilaian risiko jatuh merupakan bagian dari asuhan keperawatan yang harus diimplementasikan yang akan mengurangi risiko jatuh agar pasien bisa merasakan keamanan, kenyamanan serta keselamatan. Tujuan penelitian ini untuk mengidentifikasi adakah hubungan antara pelaksanaan penilaian risiko jatuh dengan terjadinya insiden keselamatan pasien di ruang rawat inap RSISA Semarang.

Metode: Penelitian ini menggunakan metode kuantitatif dengan pendekatan *cross sectional*. Pengumpulan data menggunakan observasi. Jumlah responden 81 perawat dengan teknik *proportionate random sampling*. Data yang diperoleh diolah menggunakan uji *Spearman*.

Hasil: Penelitian menunjukkan bahwa 66,6% responden berusia 26-35 tahun, 67,9% responden dengan jenis kelamin perempuan, 76% responden berpendidikan D3 Keperawatan, dan 64,2% responden lama kerja 1-5 tahun. Sebagian besar responden melaksanakan penilaian risiko jatuh dengan jumlah 77,8%, sedangkan insiden keselamatan pasien 4,9%.

Kesimpulan dan Saran: Terdapat hubungan yang signifikan antara pelaksanaan penilaian risiko jatuh dengan terjadinya insiden keselamatan pasien di ruang bangsal rawat inap RSISA Semarang dengan nilai *p value* 0,009 (*p value* < 0,05 dan keeratan hubungannya yaitu lemah (0,289) serta arah hubungannya positif.

Berdasarkan hasil penelitian ini dapat memberikan masukan dalam upaya peningkatan pelayanan kesehatan di RS dan perawat untuk memperhatikan keselamatan pasien dan terhindar dari risiko jatuh.

Kata kunci: Penilaian risiko jatuh, insiden keselamatan pasien.

THE RELATIONSHIP BETWEEN THE IMPLEMENTATION OF FALL RISK ASSESSMENT AND THE OCCURRENCE OF PATIENT SAFETY INCIDENT IN WARDAT SULTAN AGUNG ISLAMIC HOSPITAL SEMARANG

59 pages + 13 tables + xviii

Background: The implementation of fall risk assessment is a part of nursing care that should be implemented in order to reduce fall risk so that the patient can feel secure, comfortable and safe. The purpose of this study is to identify the relationship between the implementation of fall risk assessment and the occurrence of patient safety incident in ward at Sultan Agung Islamic Hospital Semarang.

Method: This study used quantitative method with cross sectional approach. The data collection used observation. The total of respondents was 81 nurses with proportional random sampling. The data analysis used Spearman test.

Result: The result showed that 66.6% of respondents aged 26-35 years, 67.9% of respondents were females, 76% of respondents were D3 of nursing and 64.2% of respondents had 1-5 years of working period. Most of respondents carried out the fall risk assessment as many as 77.8%, meanwhile the patient safety incident was 4.9%.

Conclusion and Suggestion: There is a significant relationship between the implementation of fall risk assessment and the occurrence of patient safety incident in ward at Sultan Agung Islamic Hospital Semarang with p-value 0.009 ($p\text{-value} < 0.05$) and the closeness of the relationship was weak (0.289) as well as the direction of the relationship was positive. Based on the result, this study can provide input in order to improve the health service at the hospital and the nurses have to pay attention to the patients so that the fall risk can be avoided.

Keywords: Fall risk assessment, patient safety incident.
