**THE CORRELATION OF SOCIAL SUPPORT FROM HUSBANDS AND
NURSE PERFORMANCE IN SULTAN AGUNG ISLAMIC HOSPITAL
SEMARANG**

63 halaman + 11 Tabel + 2 gambar + 15 Lampiran + xvi

Background: Nurse performance affects assessment on nursing service quality. Most of nurses in hospital are married women. A working wife needs help and support from her husband. If not, some problems may appear on family, quality and performance, as well as hospital image. This study aims to identify social support from husband toward nurse performance in Sultan Agung Islamic hospital Semarang.

Method: This is a quantitative study using observational method and cross sectional approach. The data were collected through questionnaire and observation. There were 47 nurses as respondents selected by using total sampling technique. The obtained data were then analyzed using spearman test.

Result: Most of the respondents (31 respondents) were 26-35 years old (66,0%), 37 of them were DIII of Nurses (78,7%), 31 of them had >3 years of work length (66,0%), 43 of them had high husband support (91,0%), 24 of them were categorized into good nurse performance (51,1%) and it indicated that there was a correlation between social support from husbands and nurse performance of fair category with correlation coefficient 0,402.

Conclusion: Sultan Agung Islamic hospital's Nurses have high social support from the husbands with good nurse performance. It obtains high category social support of husbands with high category of nurse performance 55,8%, fair category 17%, and low category 4,7%.

Keywords: Social Support from Husbands, Nurse Performance
